Bears, Climate Change and Snow

Climate change has the potential to increase the pressure of top-down/bottom-up factors

Mike Gere

Research Objectives

Develop a fine-scale remote sensing snow cover product and use it to explore the relationship between spring season snow dynamics and grizzly bear habitat selection and use.

1. Develop fine-scale snow maps
2. Use new maps to explore bear habitat selection and use

Objective 1: Fine-Scale Snow Mapping

**Daily MODIS NDSI snow cover
(500 m)**

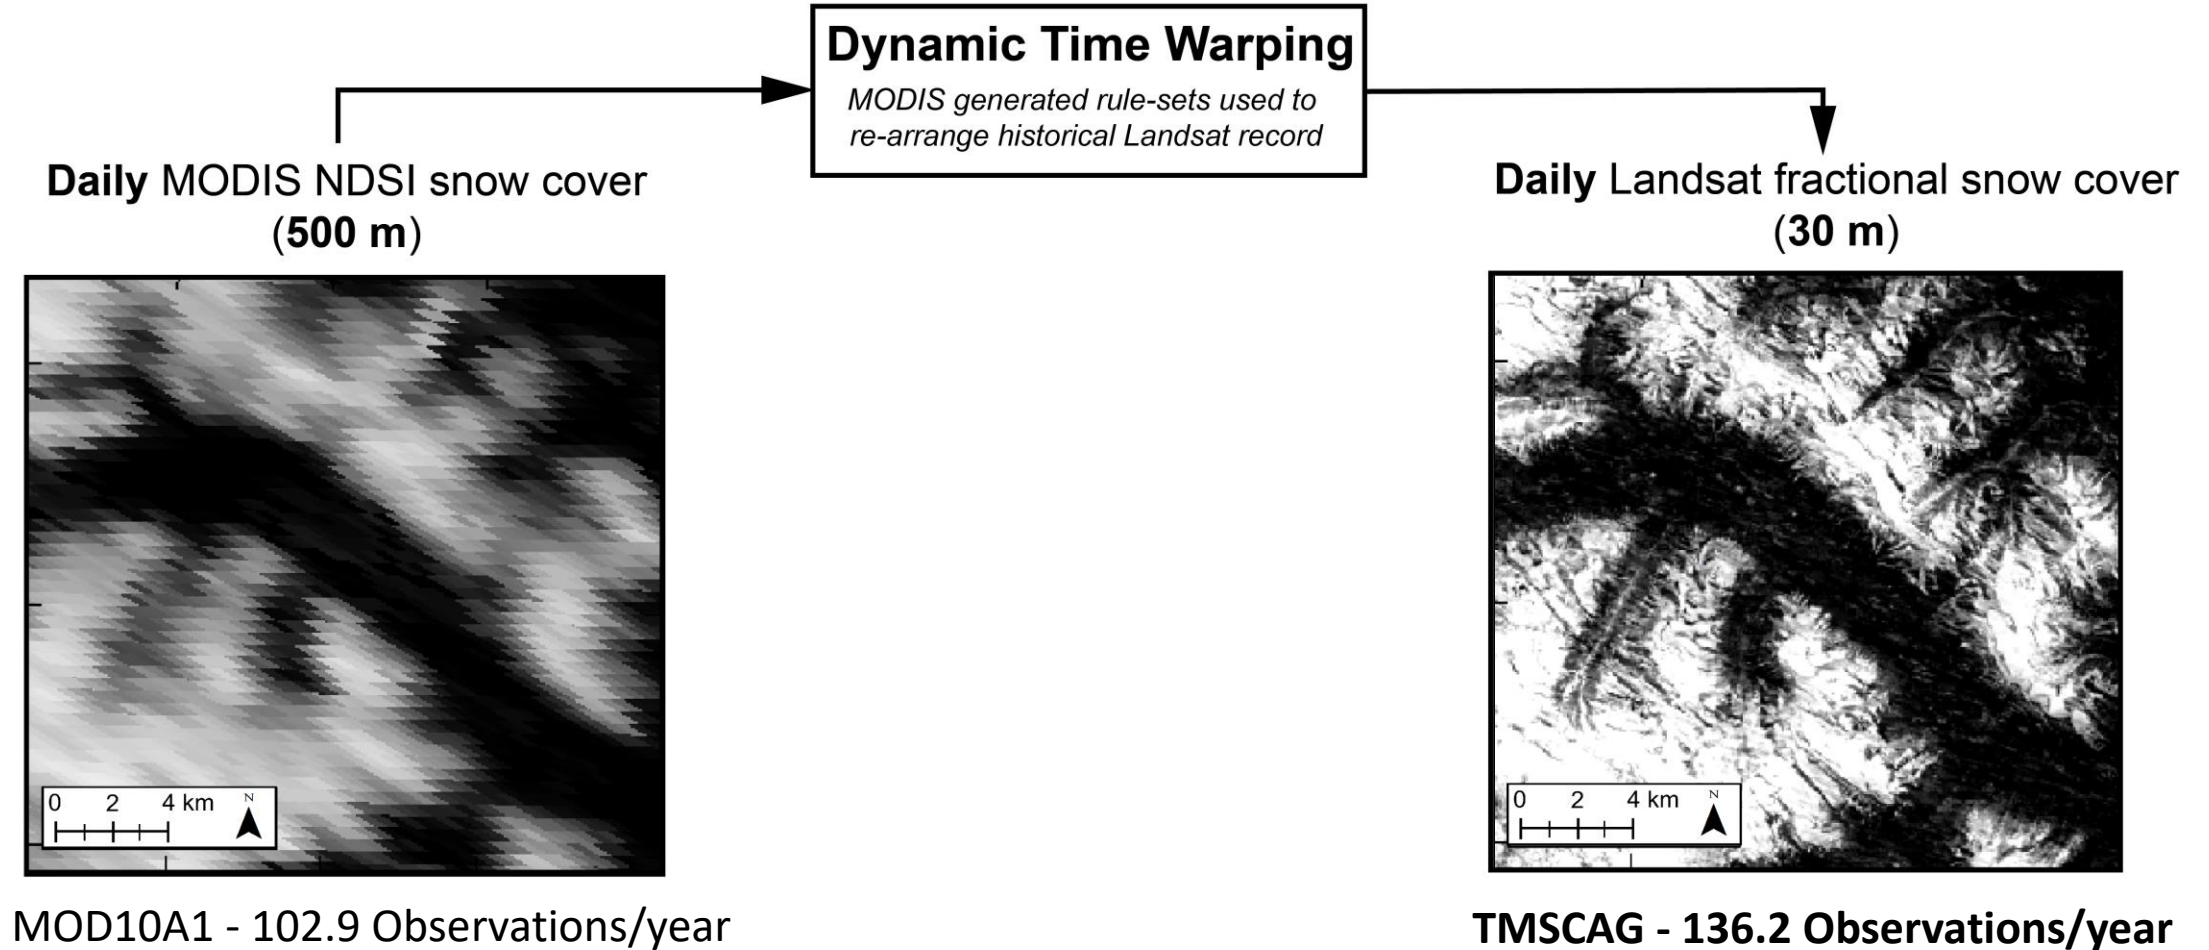

MOD10A1 - 102.9 Observations/year

**16-Day Landsat fractional snow cover
(30 m)**

TMSCAG - 14.8 Observations/year

SNOWARP: Daily 30-m Fractional Snow Covered Area (fSCA)

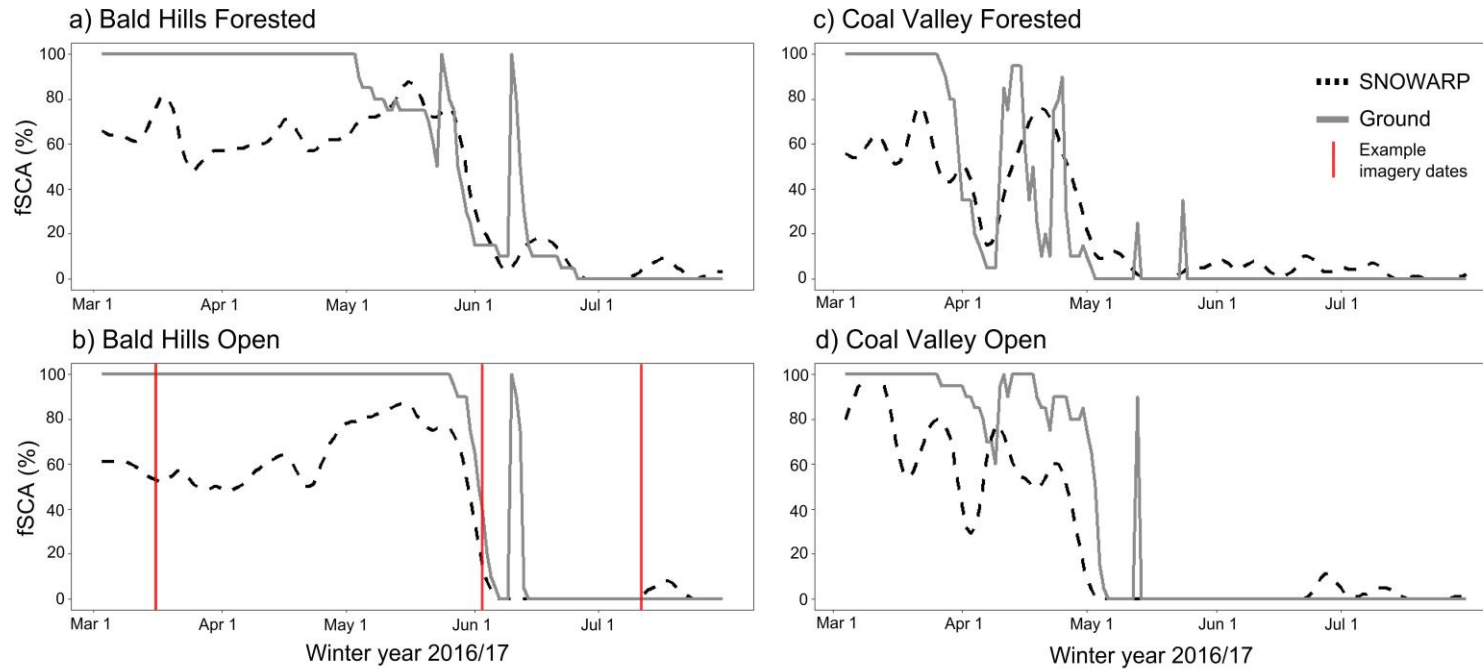

2016-08-01

0 2.5 5Km

Ground-Based Testing

e) Example time-lapse imagery from Bald Hills Open

Objective 2

Use SNOWARP to inform our understanding of grizzly bear habitat selection and use during spring season

Hypothesis: Selecting for lower snow cover, earlier transition

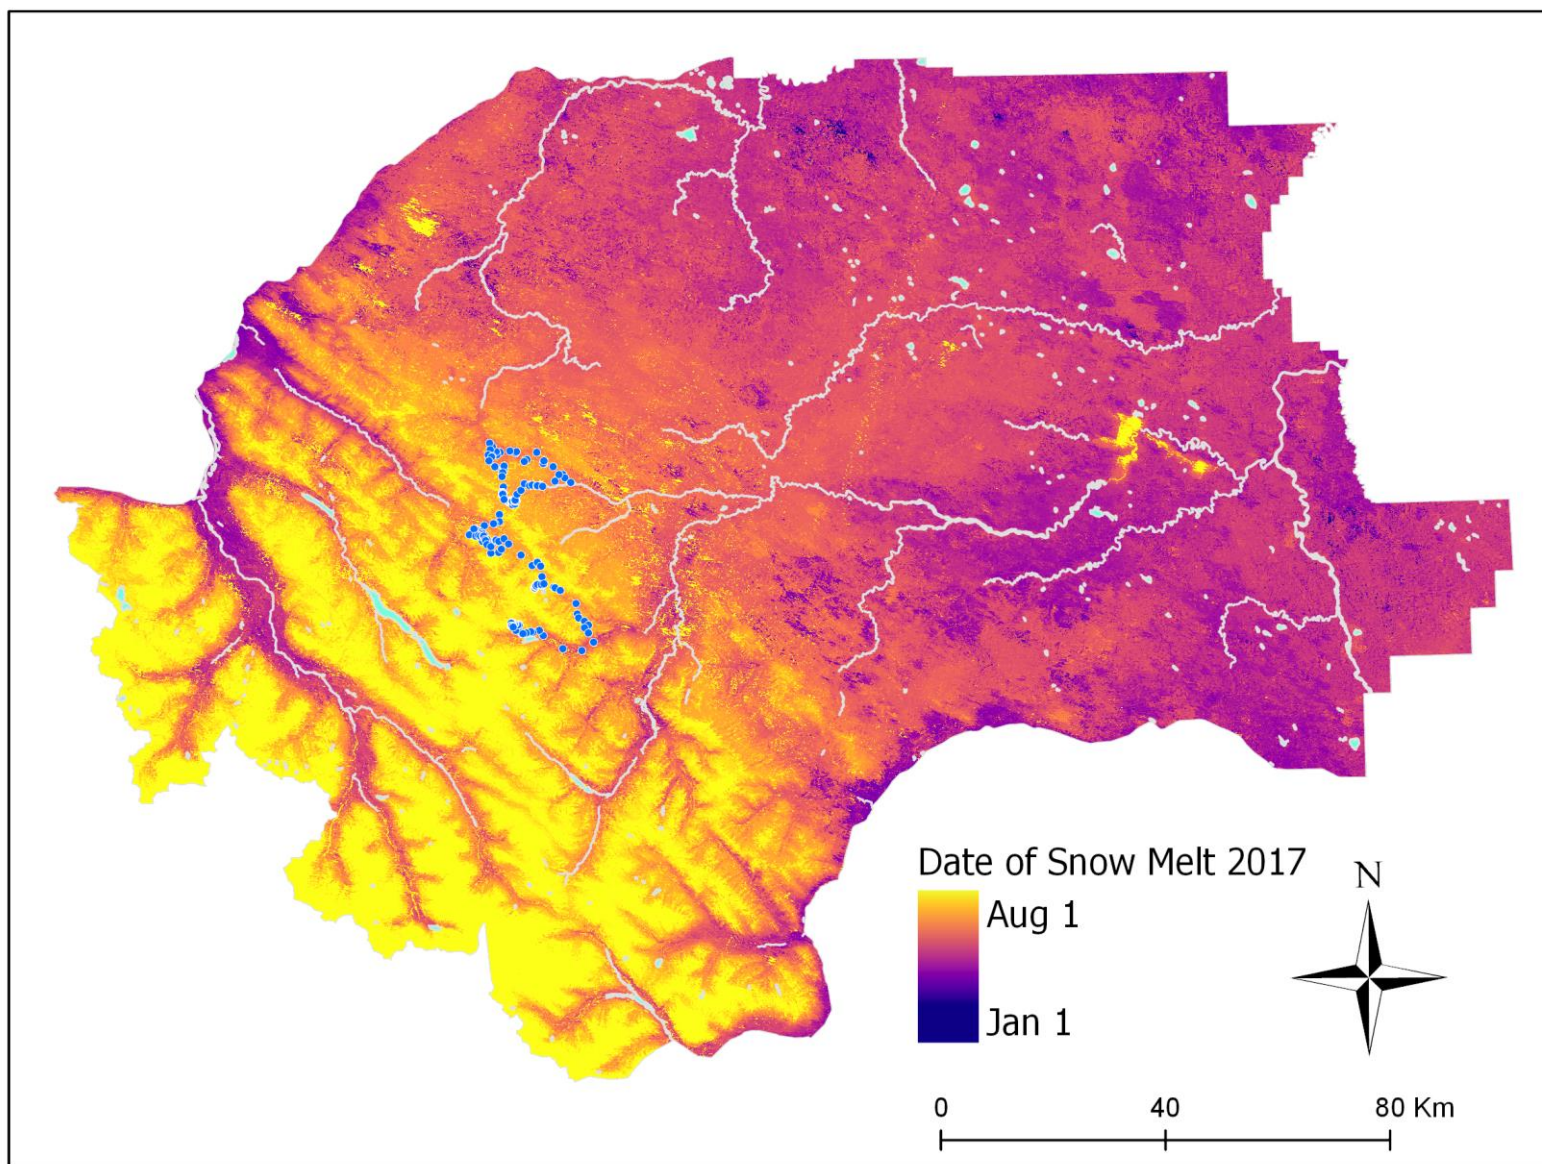

Cam McClelland

Modelling Approach

- Used vs. Available steps
- Core Environmental Variables
 - Step length, time of day, elevation, distance to road, terrain wetness, distance to forest edge, landcover, solar insulation
- Snow Variables
 - Fractional snow covered area, binary snow covered area, days since snow melt

Model Comparison

Model	AIC Tally	Average AIC Weight
Core	11	0.1460
Days since snow melt (DSM)	9	0.1508
Binary snow covered area (bSCA)	5	0.1357
Fractional snow covered area (fSCA)	37	0.5675

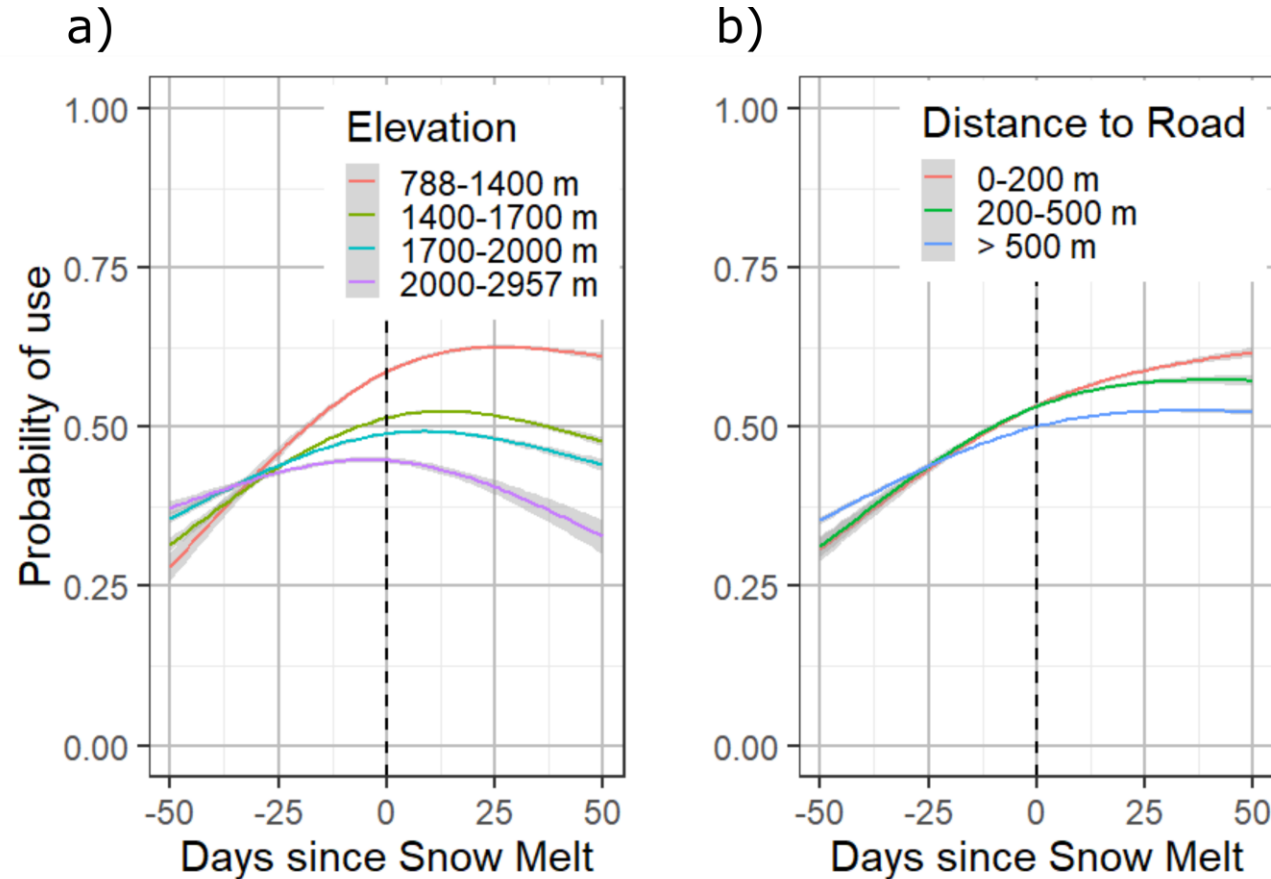

How does snow influence grizzly bear use of the landscape?

Population Average

More likely to use snow free areas and areas where snow melted sooner

By Elevation and Distance to Road

More likely to use lower elevation locations, especially when snow free/earlier melt

More likely to use locations closer to roads, especially after snow melt

Main Outcomes and Implications

- Objective 1
 - SNOWARP and applications
- Objective 2
 - Baseline relationship
 - Climate change and bear management

Bear habitat selection and use

- Snow cover
- Periods post snow melt

Future climatic conditions

- Warmer, more uncertain winter and spring seasons
- Less days with snow cover

Management

- More bears on landscape
- Human-bear encounters
- Areas of high risk during spring

Main Outcomes and Implications

Outcomes

- Objective 1
 - SNOWARP and applications
- Objective 2
 - Baseline relationship
 - Climate change and bear management

Implications

- Future climate:
 - Warmer, more uncertain seasons
 - Less days with snow cover
- Management
 - More bears at lower elevations
 - Risk of human-bear encounters
 - Areas of high risk during spring

Thank You...
