

Grizzly-PAW: Grizzly Population
Assessment in yellowWhead: Integrated
Approaches Toward Conserving Grizzly
Bears On A Human-Dominated Landscape
Of Western Alberta.

Annual General Meeting – 3

Sean Kearney

Calgary, AB | October 18, 2019

Research questions

- Q4. Have changing landscape conditions associated with anthropogenic natural resource extraction activities resulted in changes in habitat selection by grizzly bears within the study area?
- Q5. Are the movement patterns of grizzly bears being impacted by natural resource extraction activities, including the development and use of roads and linear features?

Forest Ecology and Management

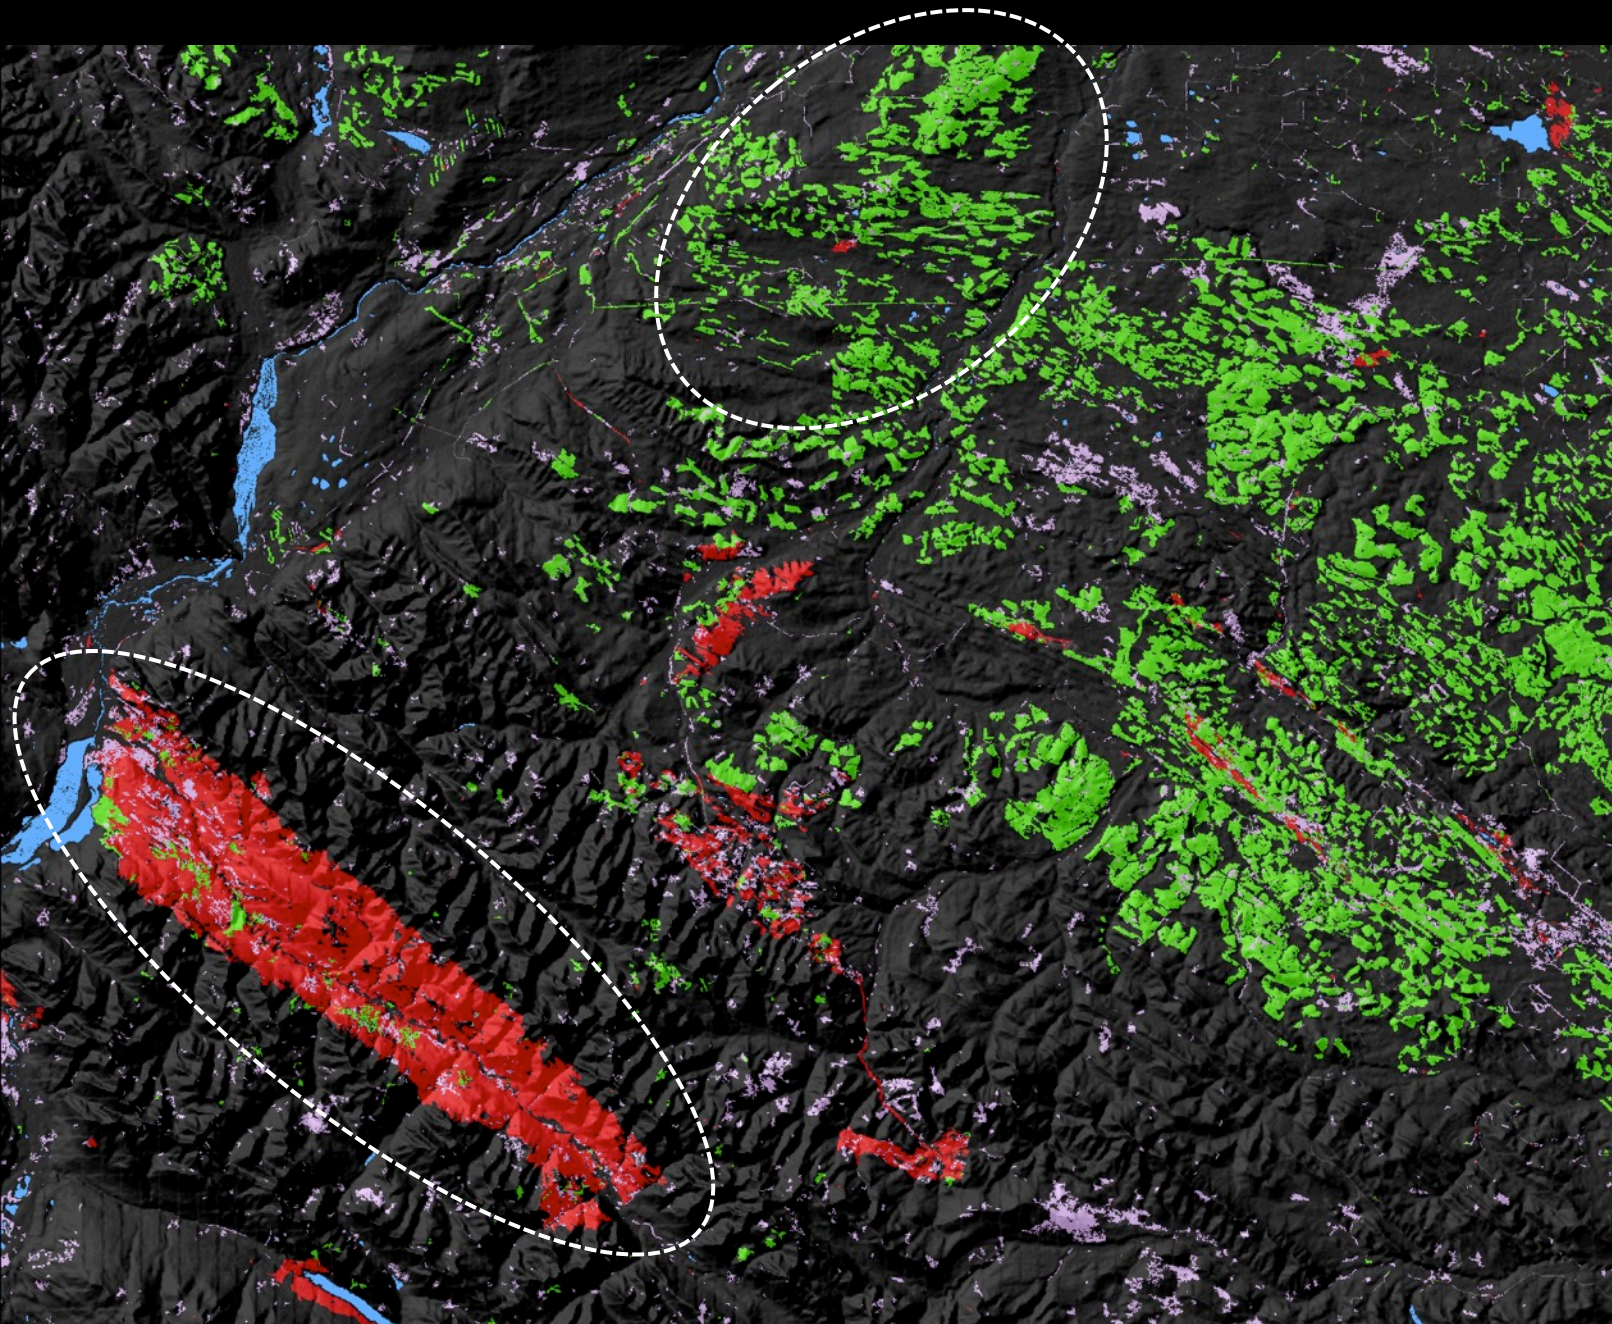

journal homepage: www.elsevier.com/locate/foreco

Grizzly bear selection of recently harvested forests is dependent on forest recovery rate and landscape composition

Automated rural road detection and classification

Photo: Aaron Huey/National Geographic

Developed and compared three road classifications that relate to use/traffic

1. Network based approach
2. Image-based approach
3. Reference (simplification of the GOA classes)

Network-based classification

Recreation

Industry

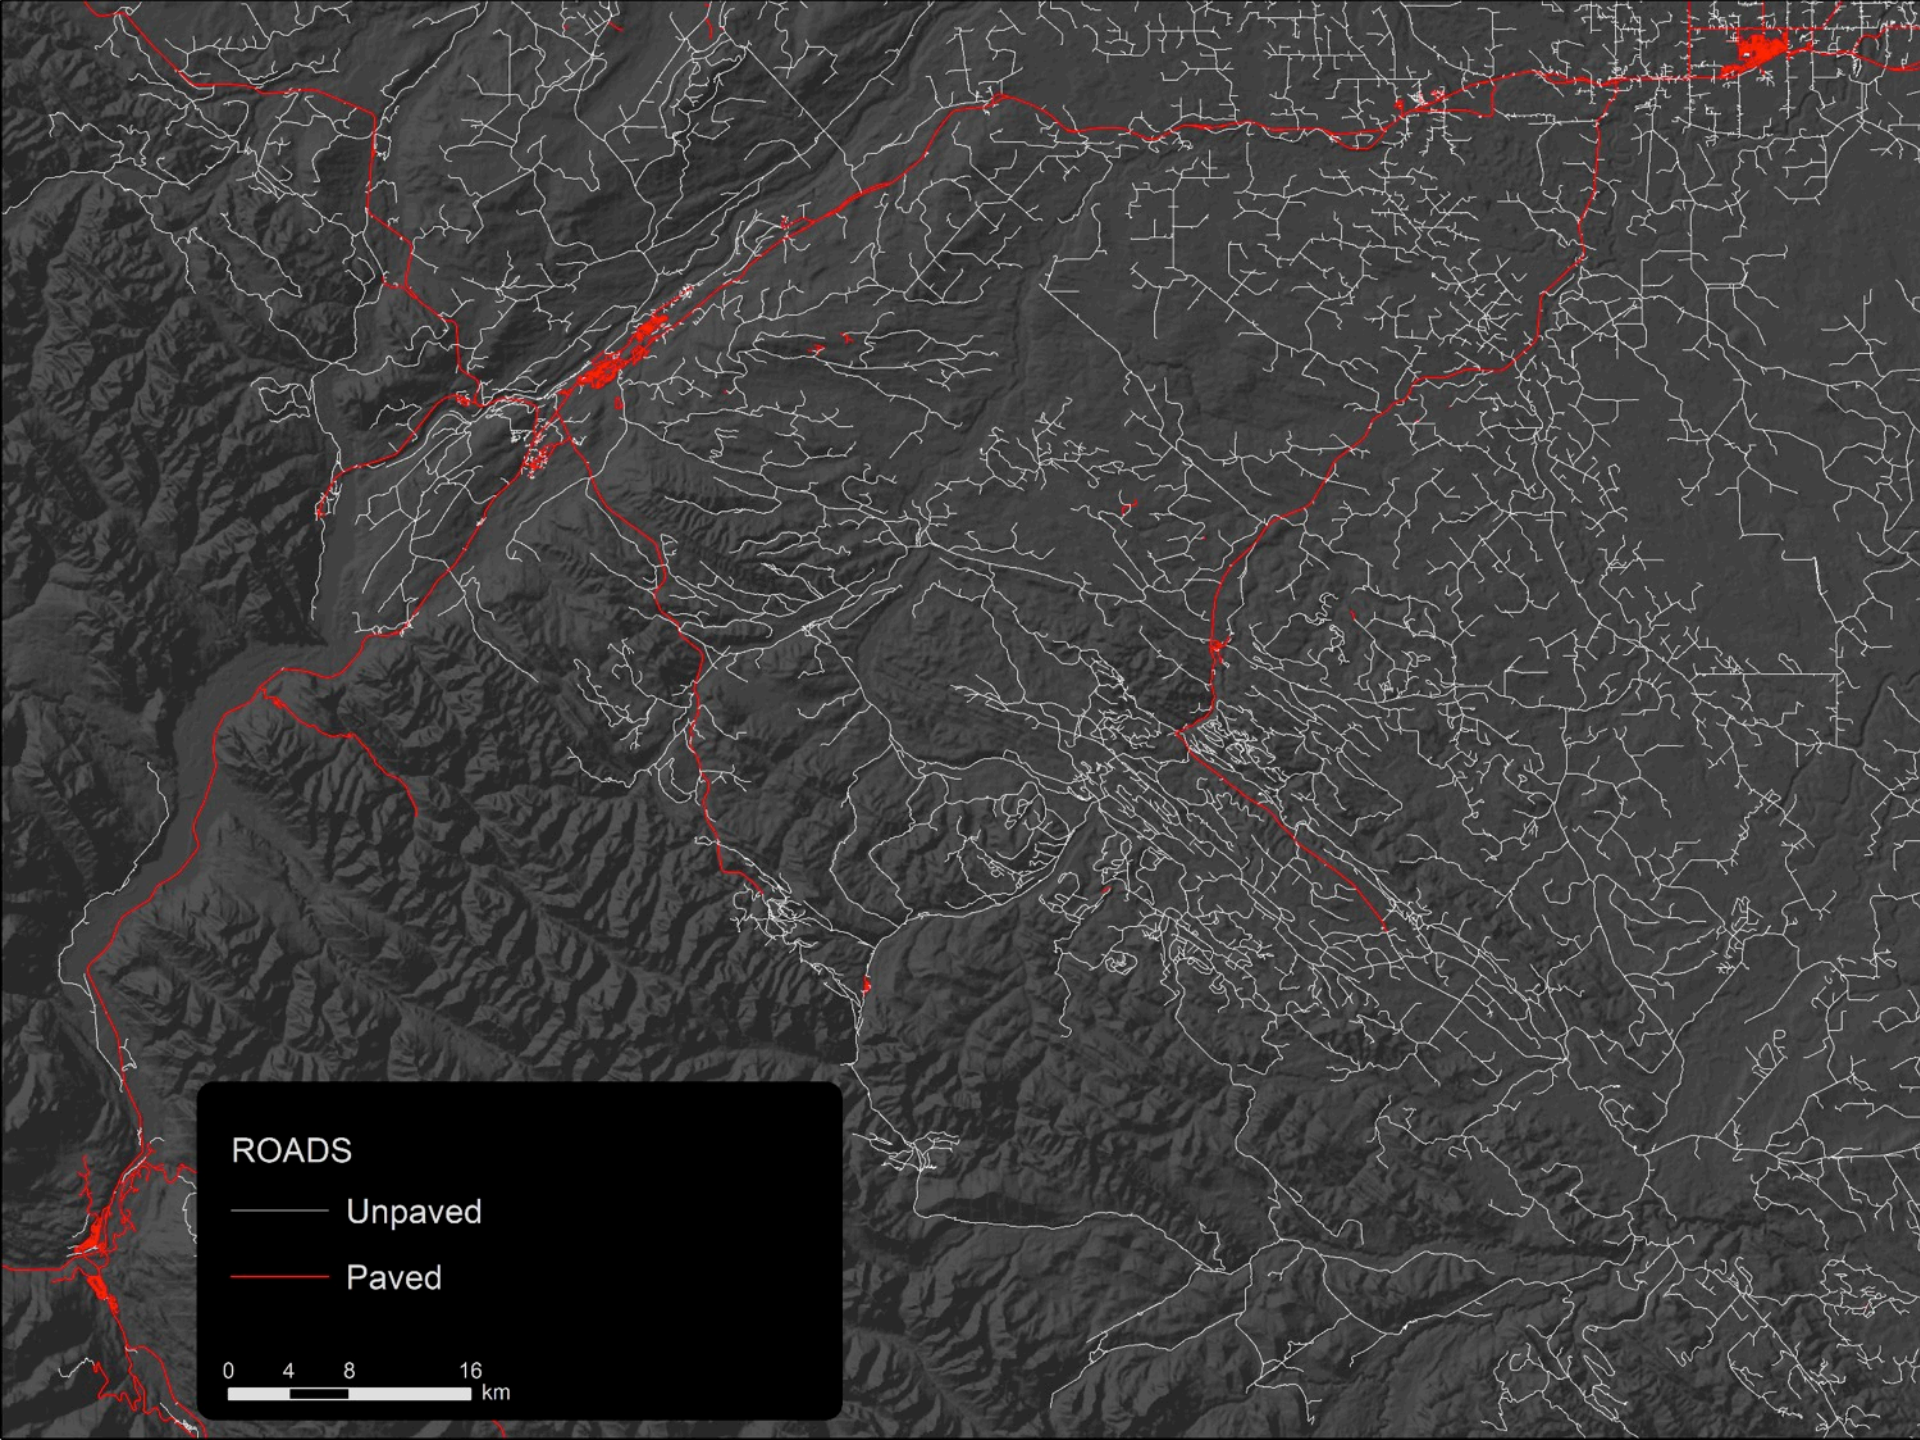

Forestry

- Satellite-detected

Oil/Gas

- Active wells

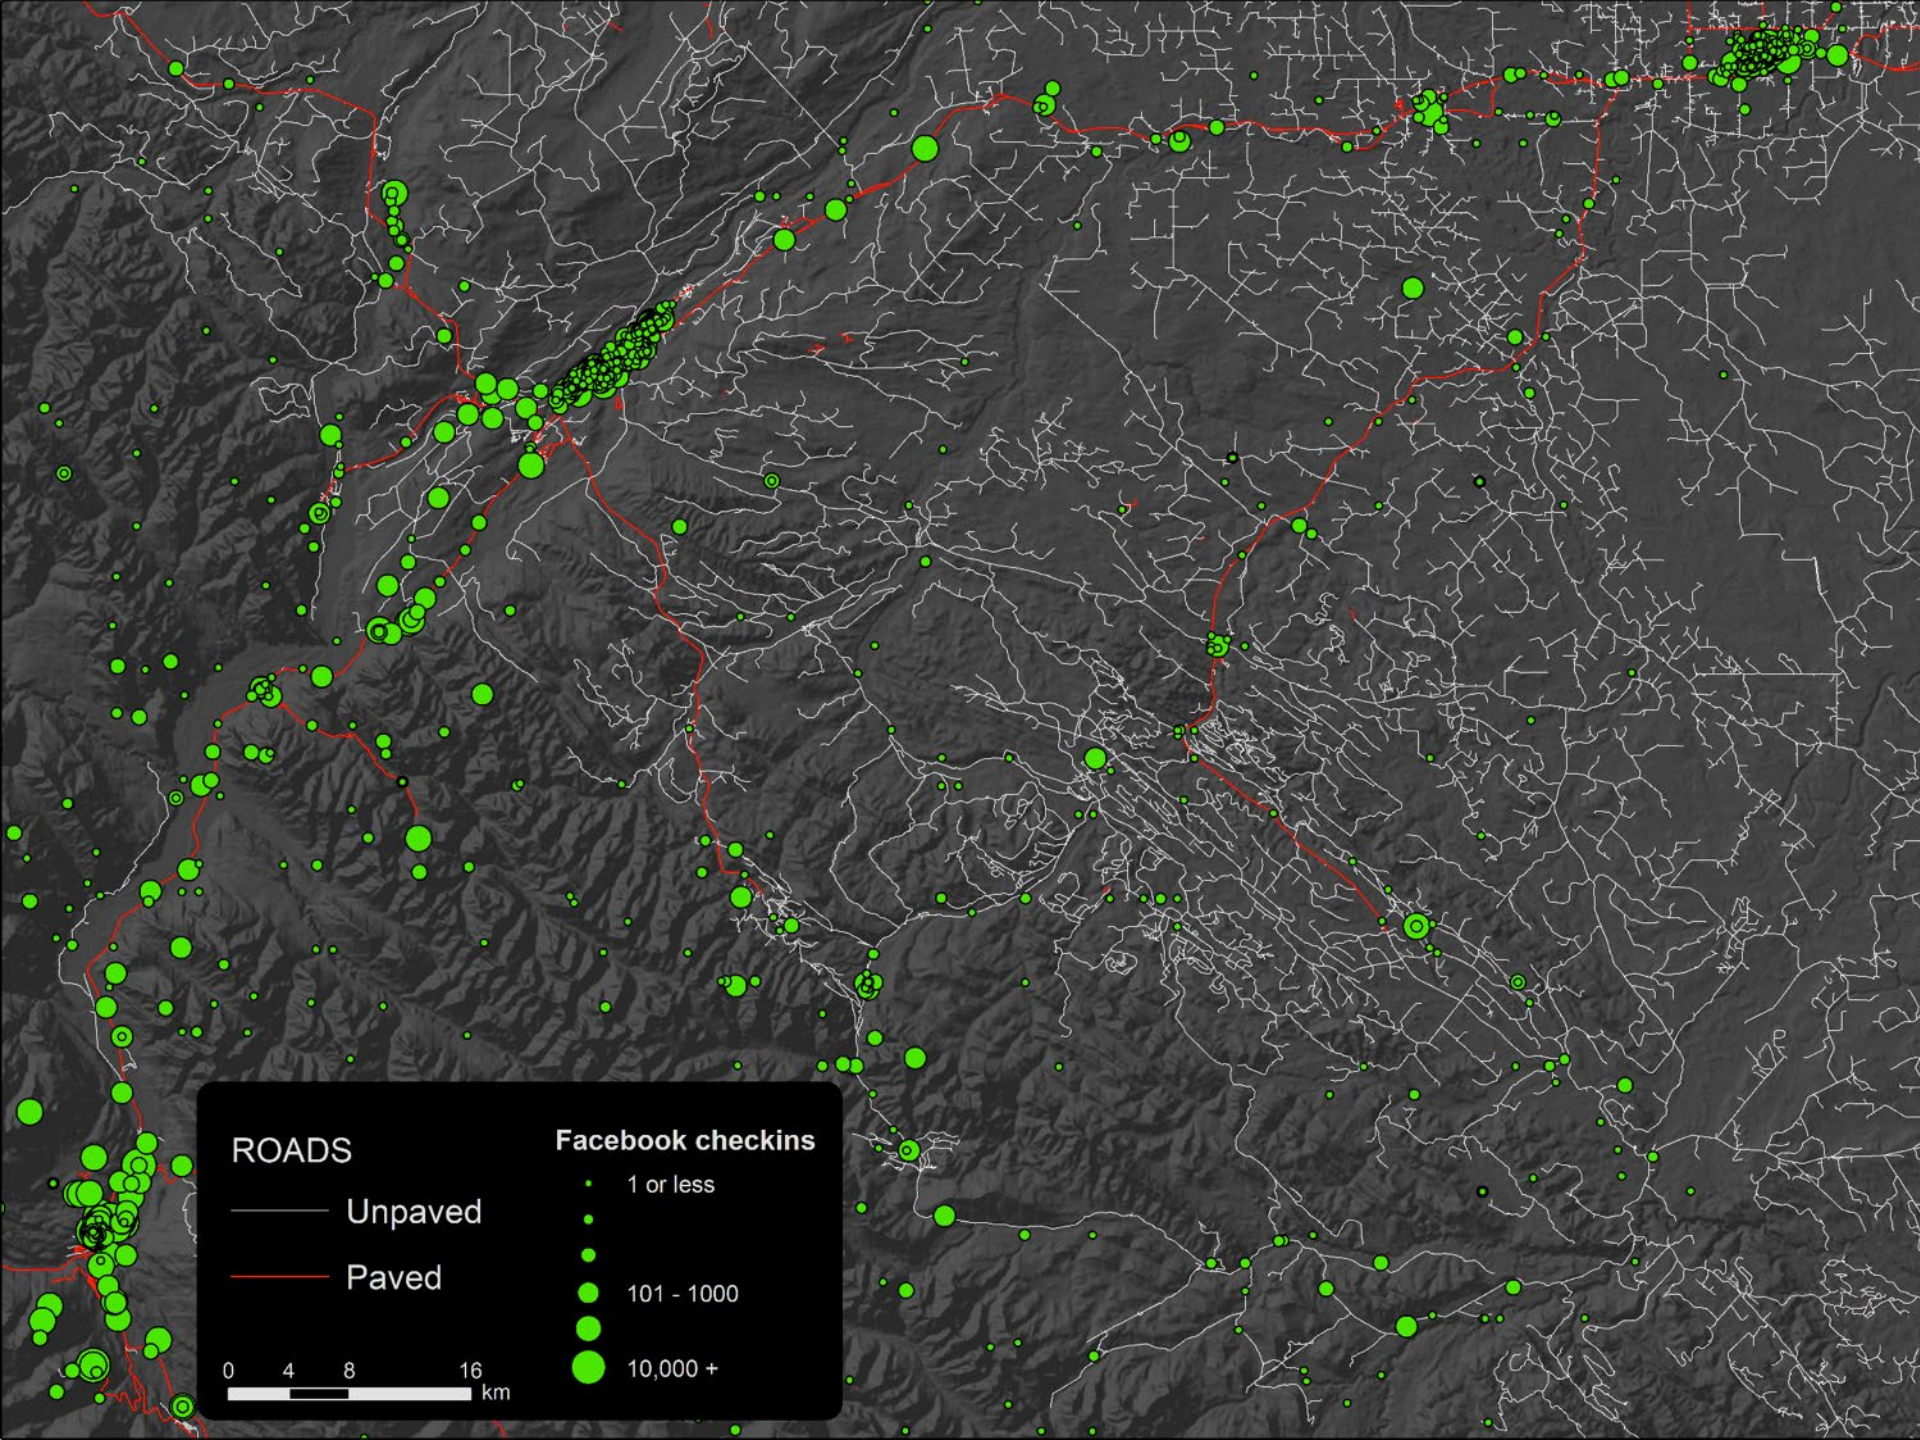

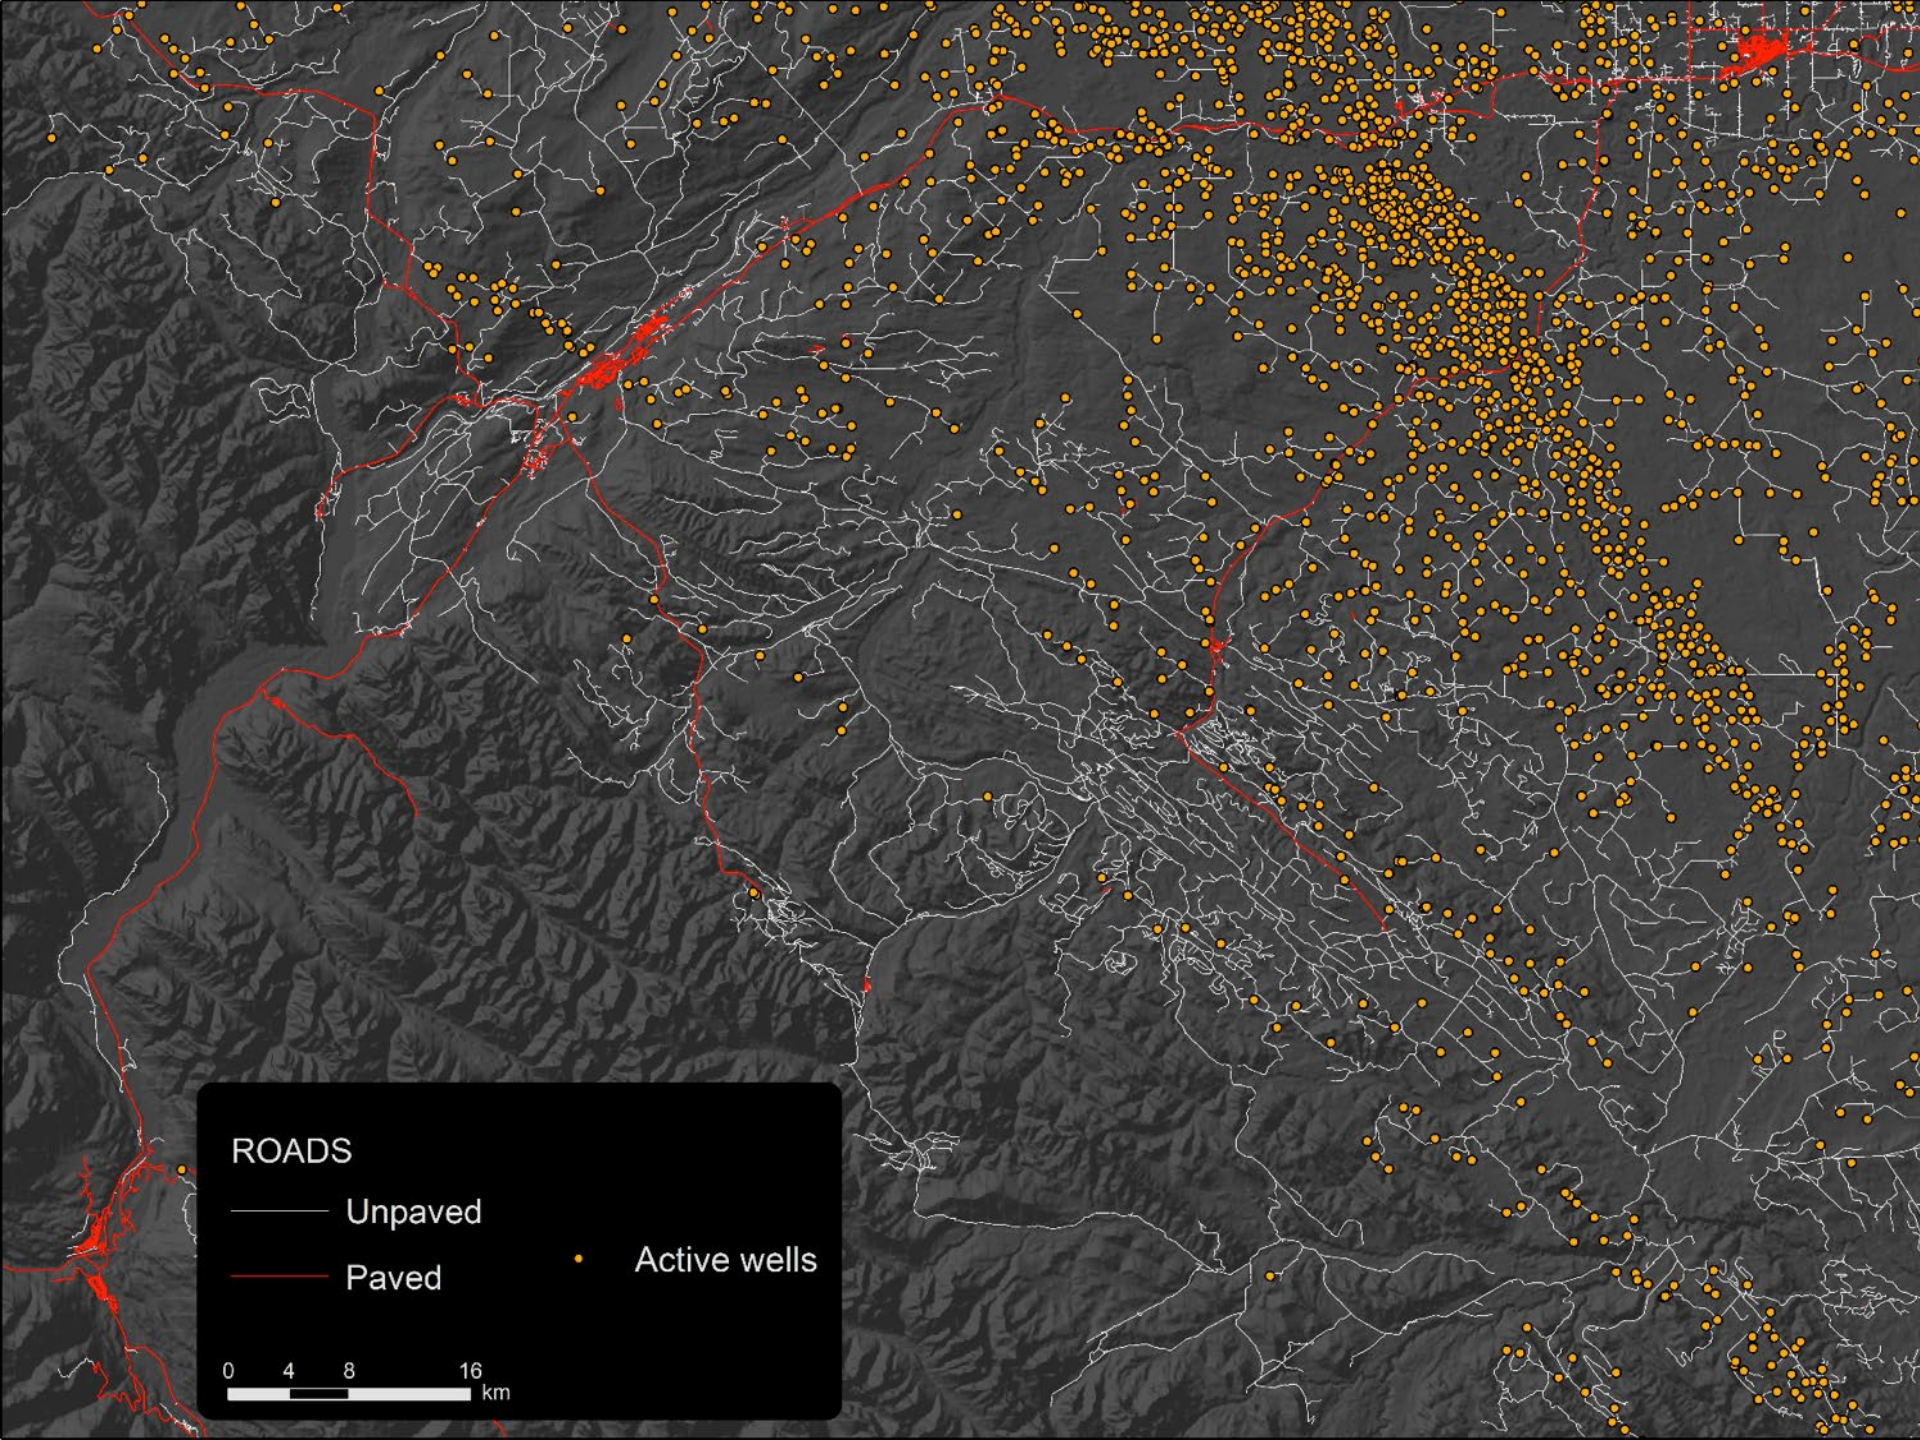

ROADS

Low

0 4 8 16 km

Forestry

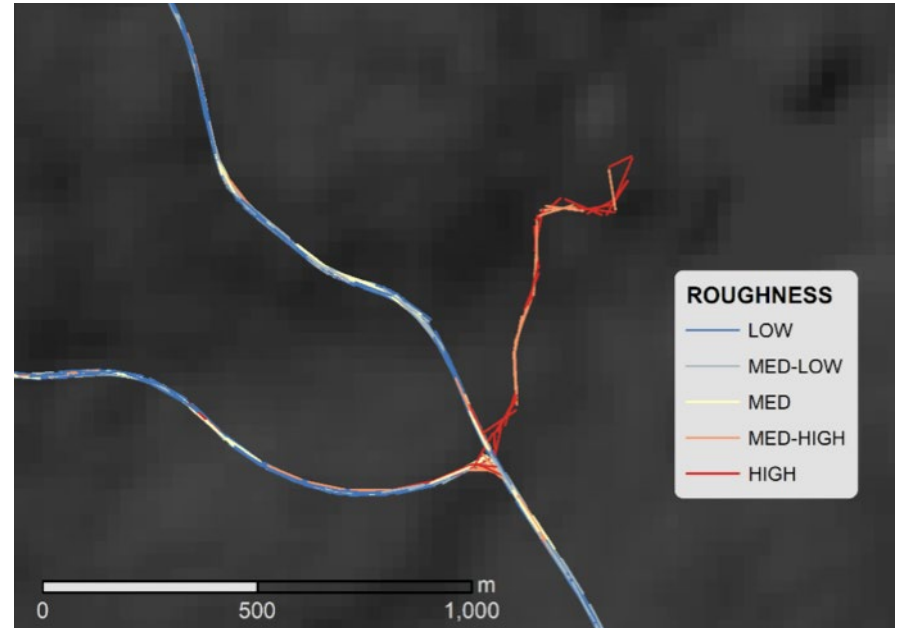

High

Low

0 4 8 16 km

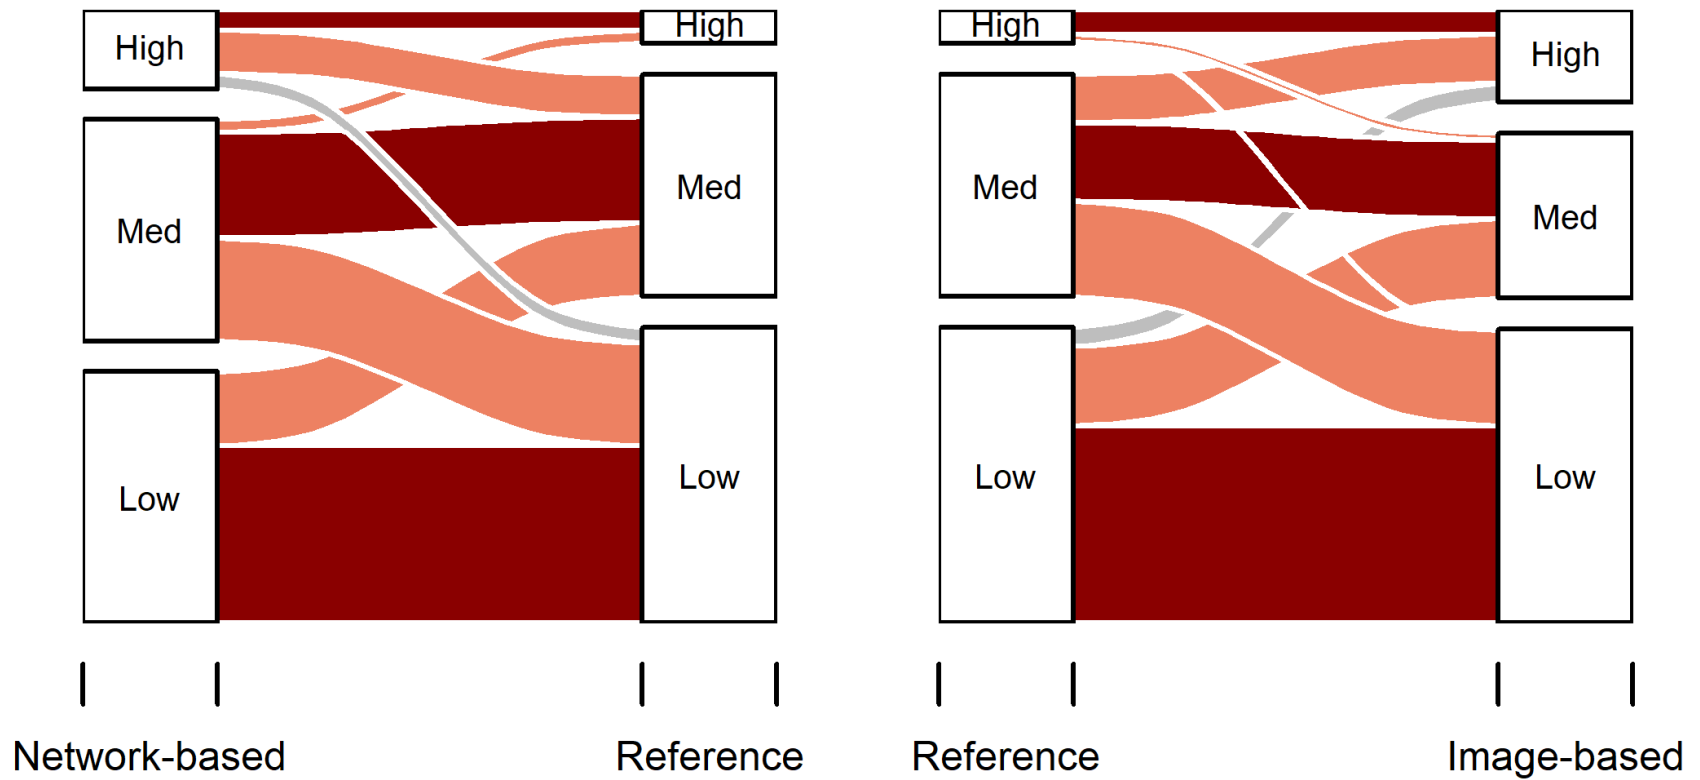

Image-based classification

Reference (GOA) classification

- High: 2-lane gravel
- Med: 1-lane gravel
- Low: all other unpaved (e.g., 'unimproved', 'truck-trail', 'temporary', etc.)

Preliminary results

Preliminary results

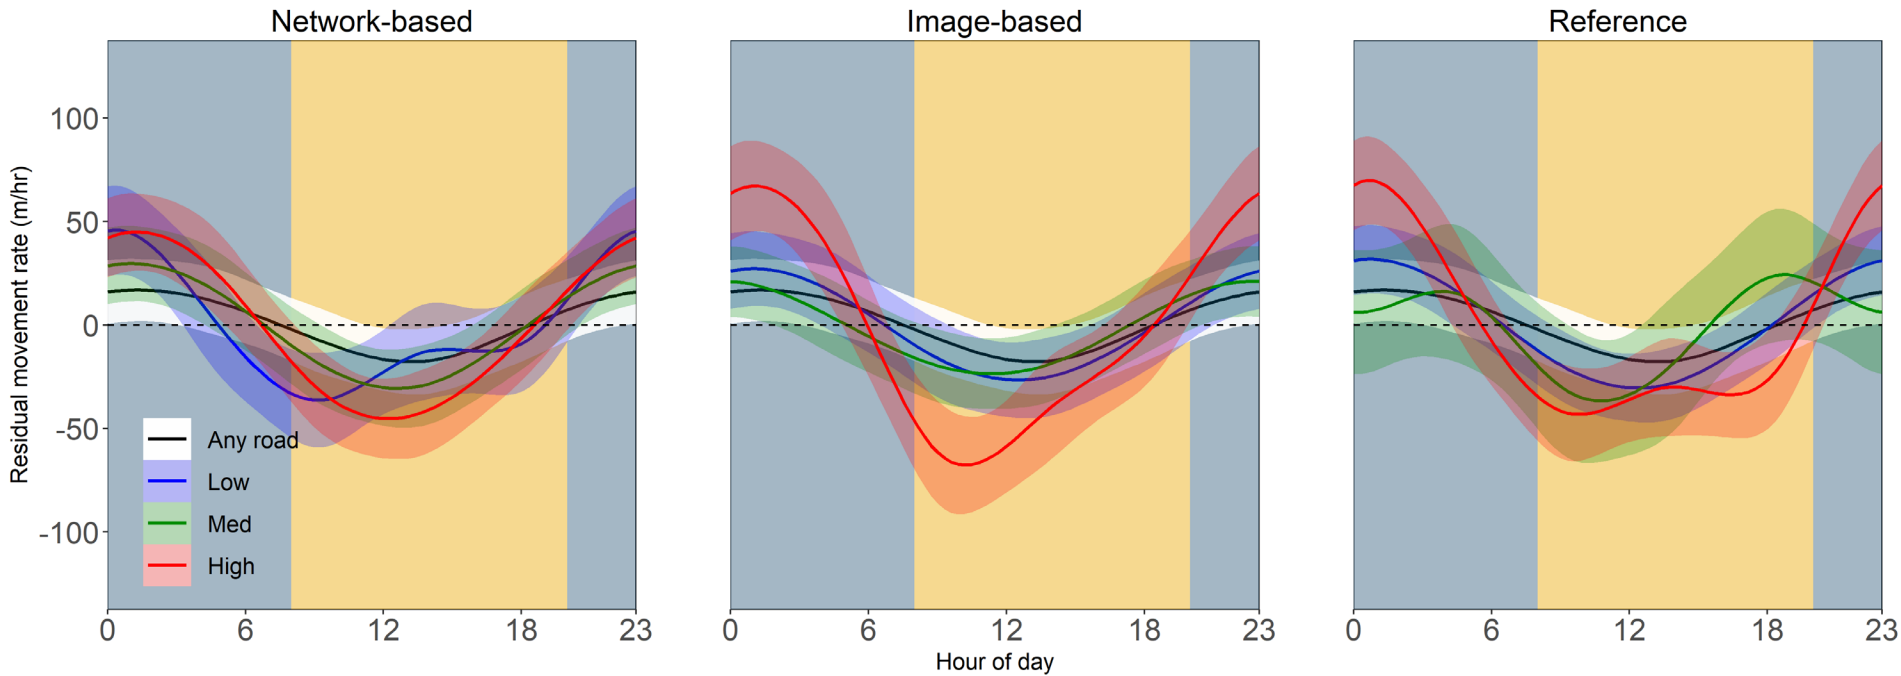

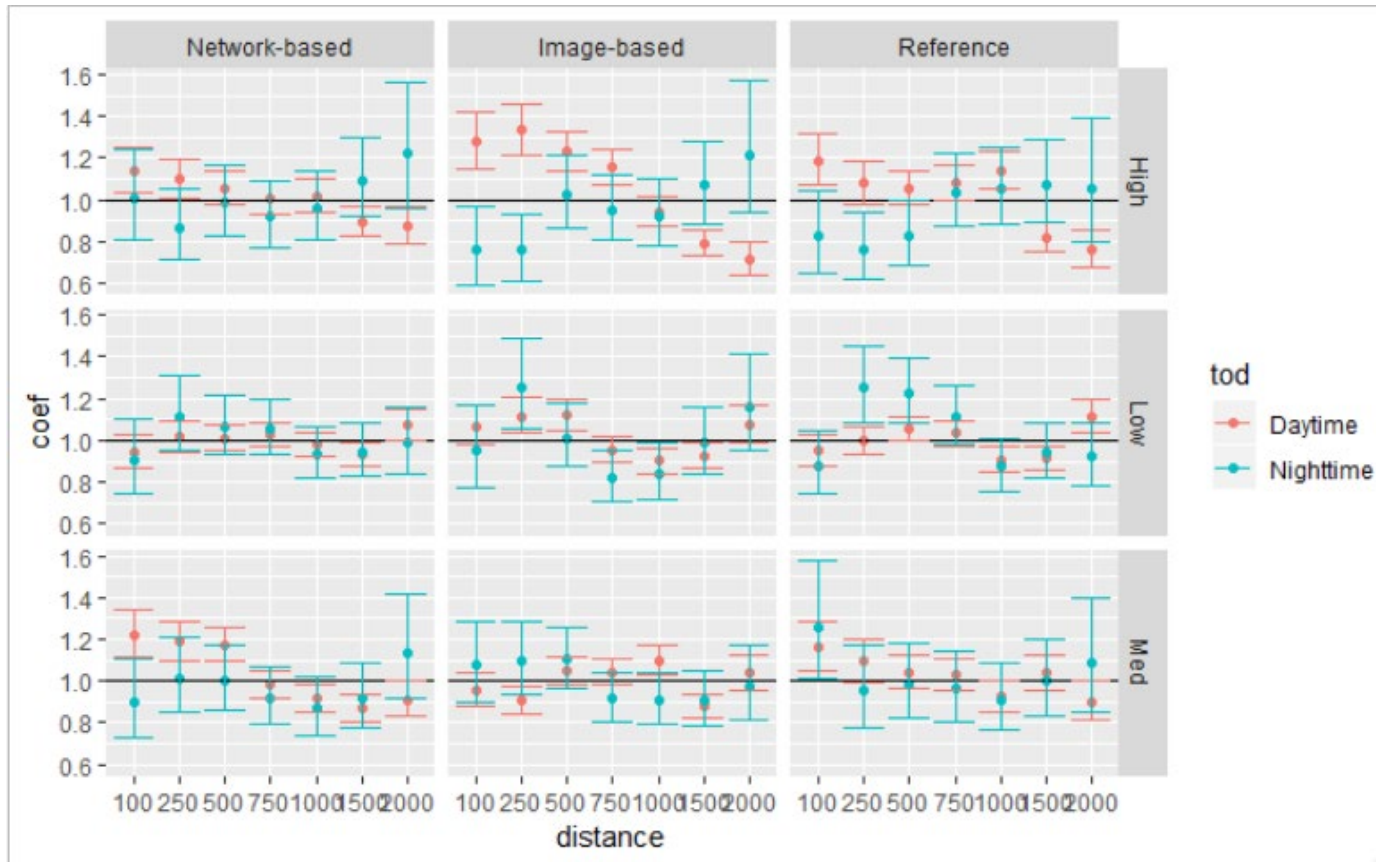

Figure: Diurnal deviation from expected movement rates by road class for the three classifications

Preliminary results

Fine-scale selection (step selection function)

Early conclusions

- Simple GOA reclassification shows similar patterns to more complex approaches
- Image-based classification approach may best explain grizzly bear movement patterns near roads
 - Promising for regions without existing data
- Network-based approach may require refinement

Thank You for Attending
